                                                      Claim 12; Figure 2; 107pp; English.

The full-length TPKS-encoding DNA in plasmid pLOA was designated pTPKS100. Splicing of the introns from the DNA sequence and translation of the 9114 nt ORF results in a protein of 3038 AAs (R74171) with a mol. wt. of 269,090 daltons. Inspection of the TPKS AA sequence for active site residues and motifs known to be associated with polyketide synthases and fatty acid synthase (FAS) activities resulted in the identification of candidates for expected sites (see FT). Except for the presence of a methyl transferase, not present in FAS, the succession of activities on the most present in FAS, the succession of activities on the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1512
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1463 GlyPheAsnSerTyrThrTyrThrAspIleSerThrGlyPhePheGluGl 1479
                                                                                                                                            expression vector. The AEE encoded is used as a catalyst in the conversion of a peptidyl substrate to a corresp. peptidyl amide. This can be used for making a protein biologically active, e.g. calcitonin or growth hormone releasing factor. See also Q05637. Sequence 944 AA;

R;Ohsuye, K.; Kitano, K.; Wada, Y.; Fuchimura, K.; Tanaka, S.; Mizuno, K.; Matsuo, Biochem. Biophys. Res. Commun. 150, 1275-1281, 1988
A;Title: Cloning of cDNA encoding a new peptide C-terminal alpha-amidating enzyme A;Reference number: A27715; MUID:88134244
C;Comment: This copper protein is one of two enzymes that catalyze the oxidation of p le and dismutates to 91yoxyLate and the corresponding desglyvine peptide alpha-amide. hormones. The other enzyme is peptidyl alpha-amidating enzyme I.
C;Superfamily: peptidylglycine monooxygenase II; peptidylglycine monooxygenase I homo C;Keywords: copper; 91ycoprotein; monooxygenase; oxidoreductase; transmembrane protein; 1-24/Domain: signal sequence #status predicted <SIG>
